

NovaMG[®] PRO

Providing Breast Specialists with the Tools for Efficiency and Accuracy

- Single-Click Workflow and Quick Setup
- View 2D and 3D breast tomosynthesis images with a picklist of side-by-layouts
- Interrupt feature to easily move from one viewer to the next without changing layouts
- MRI Breast CAD
- Full suite of synchronized tools for current and priors.
- Automated MQSA tracking and report generation

MULTI-MODALITY WORKSTATION FOR MAXIMUM EFFICIENCY

Add NovaMG PRO, an integrated mammography viewer, to your enterprise imaging solution and eliminate the need to purchase third-party viewers. Gaining the ability to ergonomically read a wide variety of breast imaging studies – and studies from all other specialties – from a single location, you no longer need to move between the workstation or physical locations to read studies.

AUTOMATION FOR SPEED AND ACCURACY

Filled with automation and synchronizations, NovaMG PRO enables pre-processing, retrieval, and routing of images with comparison studies facilitating rapid loading and reporting. This software supports fully integrated voice recognition with an available next-generation breast-structured reporting and tracking system, improving radiologist accuracy and speed.

READ TOMOSYNTHESIS WITH UNMATCHED SPEED

Processing large datasets before they are received means reading tomosynthesis studies no longer slows you down. NovaMG PRO's tomosynthesis management features include cine speed, slice reference imaging, and slab thickness control for optimal efficiency.

RADIOLOGIST STRUCTURED REPORT OPTIONAL TRACKING AND MQSA REPORTING

Streamline breast imaging workflow from patient check-in through reporting and follow-ups. NovaMG PRO's tracking and reporting capabilities enhance patient care by automating the management of patient recalls, reminders, letter generation, statistics, and MQSA reports, saving physicians time and money.

USE TELEMAMMOGRAPHY TO WORK AND COLLABORATE REMOTELY

Accessible over the web and integrated with NovaPACS EI, NovaMG PRO enables you to read and collaborate with physicians, regardless of location. With the ability to view the entire patient workup across the enterprise – whether remotely or on-site – radiologists gain access to a wide variety of imaging and pathology.

DO MORE WITH ARTIFICIAL INTELLIGENCE

For prioritization of critical cases, a notification score appears on the worklist, alerting physicians immediately. Image AI improves cancer detection by quantifying and classifying suspicious regions on mammography images.
